

Mühlenchemie Responds to the Durum Shortage

Mühlenchemie, one of the world's best-known enterprises in the field of flour treatment, has developed customized enzyme systems that ensure efficient performance in spite of inferior flour quality. "To complement our years of expertise in raw materials, we have now invested

in a pasta laboratory of our own which will enable us to meet our customers' requirements even more specifically", says Managing Director *Lennart Kutschinski* of Mühlenchemie's latest service offer to pasta manufacturers. "On our Pavan pilot plant we can simulate practically any

industrial process. For example, at the customer's request we can test the effects of different enzyme systems and adjust the recipes accordingly. Is a compound from our Pastazym series the most suitable for treating this particular flour, or one from the EMCEdur series? How do they affect the taste, mouth feel and stability after cooking? On our pilot plant we find answers to all these questions on our customers' behalf", Kutschinski explains. Mühlenchemie's Managing Director is convinced that the new all-round service meets a very real demand. "Our applications technology enables us to find practical solutions for the pasta industry that reconcile quality and economy even in difficult times. In recent projects, for example, we have replaced 75 percent of the durum with bread wheat and achieved the same quality and color by using Pastazym. Support of this kind will become more and more significant in future." ■
